

The 8 Elements of Music are, in alphabetical order, Dynamics, Form, Harmony, Melody, Rhythm, Texture, Timbre and Tonality.

Each of the elements of music are like an ingredient in a recipe. Just a like a recipe needs a little bit of some ingredients, and a lot more of others, they all contribute to the overall flavor of the dish. The combination and amount of an ingredient is like the chef adding their personal flair and spice to a dish, so to, a musician and composer uses the elements of music to flavor their musical dish to suit their taste and personal style.

The 8 Elements of Music

The Elements of Music and their Definitions

Below you will find a simple definition of each of the Elements of Music. In other blog articles, each of the elements will be explained in more detail. There is no order of importance for the following, and teaching these concepts can be done in whatever order you choose. These are in alphabetical order for convenience.

[If you would like a copy of the Elements of Music Mind Maps that are used in this blog post, click here to get your FREE printable download.](#)

Element of Music – Dynamics

Dynamics refers to the volume of a piece of music. Music can be described as loud, or soft, or there could be gradual changes from loud to

soft, or soft to loud, depending on the performer's interpretation of the music. There are several Italian music terms that are used to describe the dynamics of a piece of music.

[If you want some more in depth information about Dynamics, click here to read the blog post.](#)

Element of Music – Form

The Form or Structure of a piece music refers to the order and arrangement of the different parts. Music vocabulary such as introduction, verse, chorus, bridge, solo, in and outro are common music terms that can be used to describe most rock or pop music. There are several more musical definitions for many more different types of musical form and structure used in classical music. [Discover more about music form and structure here](#)

Element of Music – Harmony

The simple definition of musical harmony is the sound created when two or more pitches are performed at the same time to form a chord. In modern music, the harmony often comes from instruments like the guitar and piano. These instruments often play chords that support the main melody, which is typically performed by a singer. Other pitched instruments like the bass contribute and support the harmony by providing a basis of support for both the melody and the chordal accompaniment.

The 8 Elements of Music

Element of Music – Melody

The definition of a melody is a series of pitches that make a tune. In most popular music today, the melody is like an egg, it is the binding agent that holds all the elements of music together in a piece of music. The melody is the part that people remember and will sing along to when listening.

The melody determines the harmony and tonality of the piece of music. The main melody can be heard when it is played by an instrument that has a unique timbre or tone color/quality. If the melody is meant to be happy or sad, it can drive the rhythm of the piece of music and set the tempo.

[For an in depth look at Melody, click here](#)

Element of Music – Rhythm

Rhythm in music includes several different aspects, and some prefer to use the term duration. A simple definition of this musical term is to describe how long or short a sound is. This means describing the notes of any given instrument in a piece of music as mainly long or sustained, or short.

Within this musical element, other terms are included. Tempo for example refers to the speed or pace of music. The term meter refers to the type of time signature used in the music. All these terms will be explained in further detail in another blog post.

[For more information about Rhythm in Music, click here](#)

Element of Music – Texture

Texture in music refers to the number of instruments or voices that contribute to the overall density of the music. If there are only a few instruments playing, like a duet for example, then the music can be

described as thin or sparse. On the other hand, if there are several instruments performing together, like in an orchestra, the piece can be described as either thick or dense. Texture also refers to the layers of sound in a piece of music, these layers are named by their role within a piece of music.

There are several specialized terms that are used to describe the type of texture used in a piece of music. These include monophonic, homophonic, heterophonic and polyphonic.

[Find out more about Texture in Music here.](#)

Element of Music – Timbre

Timbre in music refers to the unique sound quality of an instrument. For example, a nylon string guitar and a steel string guitar each have a unique sound, and just by hearing them we can determine the instrument. Timbre can also be described using the term tone color. Just like in a painting and the use of different color creates different images, the “color” of an instrument is like painting sound for our ears to hear. Every instrument and voice have their own unique sound, and it is this quality that makes a piece of music unique.

Under the banner of timbre and tone color, is another term – performing media. Performing media refers to the instruments used in a piece of music and the action used to produce a sound. This action is then used to classify an instrument into groups like the string family, brass family, woodwind family, percussion family and voices. There are several other ways to classify instruments with other terms like aerophone, chordophone, membranophone, idiophone and electronic sound.

Timbre, performing media and tone color also describes the role of the instrument in a piece of music. Is the instrument performing the melody, beat, rhythmic accompaniment, chordal accompaniment or harmonic accompaniment?

[Read more about Timbre here](#)

Element of Music – Tonality

Tonality in music refers to the overall sound of the music. Is the music mainly pleasant sounding (consonant) or unpleasant sounding (dissonant)? Or is the music in a major, minor key? Often a lot of world music has a tonality based on an unusual scale like the medieval modes, or Indian raga.

The Concepts of Music

Depending on where you are in the world, some people use the term “Concepts of Music” instead of the Elements of Music. In this case, the Concepts of Music are, in alphabetical order – Duration, Dynamics and Expressive Techniques, Pitch, Structure, Texture and lastly Tone Colour.

If you are studying music using these terms, below is a brief definition of each.

- Duration – how long or short a sound is. This is the same as Rhythm in the Elements of Music.
- Dynamics and Expressive Techniques – dynamics refers to how loud or soft the music is. Expressive techniques refers to the articulation and unique sound production methods of an instrument. For this concept of music, mostly Italian terms are used, such as forte, pianissimo, rallentando, pizzicato, mordent, trill, crescendo and many, many more.
- Pitch – how high or low a sound is. Under the umbrella of this concept of music are the musical elements of harmony, melody and tonality.
- Structure – the order and arrangement of the parts of the piece of music. The element of music equivalent is the musical term –

form.

- Texture – how sparse or dense the music is. It is the same as the Element of Music – texture.
- Tone Colour – the instruments used in a piece of music. This concept of music uses the element of music Timbre, but also includes performing media.

Why are the Elements of Music Important?

To have a solid understanding of the Elements of Music as a musician, performer or composer is essential. It is like a chef knowing what ingredients to add to a dish, or knowing what flavors work best in combination together.

As a musician and performer, if you understand the different parts of the music, and how they combine to make the whole, then it will improve your own performances. It might be that your performance is lacking in some way. If this is the case, look at how the elements of music are being used? Are you adding too much into the melody? Are you not supporting the melody with enough of a driving beat or interesting rhythm? Is the texture too sparse? Is there too many of the same instrument performing and competing in the same space and role with the same sound? Are there different timbres or tone colors fighting with each other to be heard?

Knowing your elements of music is just as important as a composer. You should be asking the same questions when you are trying to write music. Be critical of your process and style. Do you favor a certain sound? Can you change it? Do you only write for a certain voice or genre? How can you add or take away an element of music to create something even better?

The Elements of Music and Music Appreciation

No matter if you are a music enthusiast, a music student or a professional in the music industry, knowing the Elements of Music will help you develop a critical ear.

It will benefit you and your music knowing your ingredients and how best to use them.

So next time you are listening to a piece of music, try to separate out the parts and listen to how each of the Elements of Music are being used. Listen for the Dynamics, Form, Harmony, Melody, Rhythm, Texture, Timbre and Tonality. You might even want to start keeping a listening journal of the music you hear. Make a note of the song title, the performer, and try to determine how each of the Elements of Music are being used. Over time you will begin to appreciate music in a whole other way.

Remember that the Elements of Music are like ingredients in a recipe. Sometimes, it is a good thing to try something new. You never know, you might like the flavor!
